

Automated Network Request Management

Project Details

Field	Details
Date	30 July 2026
Team ID	Individual / Solo Project
Project Name	Automated Network Request Management in ServiceNow
Student	Lella Praneeth
Maximum Marks	4 Marks

Ideation Phase: Empathize & Discover

Empathy Map Canvas

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes. It is a useful tool that helps teams better understand their users. Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

Applied to This Project: Automated Network Request Management

Persona: An Employee needing network access or firewall changes through the current manual, email-based process.

Think & Feel "I hope this doesn't take another week to get approved." "Why can't I just submit a simple form for network access?" "I'm worried my project will be delayed because I can't connect to the server."	Hear - Colleagues complaining about slow IT turnaround times for network changes. - Manager asking why the system integration still isn't working due to firewall blocks.
---	---

See • A long, unanswered email thread with the network operations/helpdesk team. • No status tracker or dashboard to check request progress.	Say & Do • Sends follow-up emails and pings network admins on chat repeatedly. • Asks a manager to escalate the request informally. • Delays project deployment while waiting for the port to be opened.
Pain • No visibility into approval or fulfillment status of network changes. • Delays impact project deadlines and system deployments. • Uncertainty over security approvals.	Gain • A simple self-service catalog request in a few clicks. • Real-time status tracking without contacting IT. • Faster, predictable turnaround with automated approval and configuration deployment.

Insight Summary

The employee's core pain stems from a lack of visibility and predictability in the network request process. This directly supports the project's goal of building a self-service Service Catalog item with automated approval routing and real-time status tracking, so employees always know where their network request stands and gain access faster securely.
